

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

AMENDMENTS TO THE CLAIMS

Please add the following new claims:

LISTING OF CLAIMS:

1. (original): A multi-media system for transferring a single program transport stream comprising:

an input device for entering a program number of an intended program;

a receiver including a first digital interface, the receiver receiving a multi-program transport stream and, when extracting only a single program transport stream of a program corresponding to the program number from the received multi-program transport stream, transferring the extracted single program transport stream together with a corrected program association table (PAT) including the program number and program information corresponding to the program number; and

a recording/reproducing device including a second digital interface, for receiving the transferred extracted single program transport stream together with the corrected program association table and recording the single program transport stream transferred from the receiver via the second digital interface, for reproducing the recorded single program transport stream, and for transferring the reproduced single program transport stream to the receiver via the first digital interface, wherein receiving the single program transport stream together with the corrected program association table by the recording/reproducing device obviates need for a selection device associated with the recording/reproducing device to select a program for recording.

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

2. (original): The multi-media system of claim 1, wherein the input device is a remote controller.

3. (original): A multi-media system for transferring a single program transport stream, including at least a receiver for receiving a multi-program transport stream and a recording/reproducing device for recording/reproducing a selected single program transport stream,

wherein the receiver comprises:

an input device for entering a program number of an intended program;

a first signal processor for parsing a program association table (PAT) from the received multi-program transport stream, and for separating a video stream and an audio stream of an intended program, based on the parsed PAT, to decode a video signal and an audio signal, respectively;

a PAT corrector for correcting the parsed PAT to output a corrected PAT including the program number and program information corresponding to the program number;

a single transport stream extractor, which, when extracting only the selected single transport stream corresponding to the program number from the received multi-program transport stream, outputs the selected single program transport stream, together with the corrected PAT; and

a first digital interface for transferring the selected single program transport stream and said corrected PAT as isochronous packets, and

wherein the recording/reproducing device comprises:

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

a second digital interface for depacketizing the single program transport stream transferred as the isochronous packets via the first digital interface; and

a second signal processor for recording the selected single program transport stream, provided by the second digital interface, onto a recording medium, and for providing a reproduced single program transport stream reproduced from the recording medium to the second digital interface, wherein said transferring of said selected single program transport stream and said corrected PAT obviates need for a selection device associated with the recording/reproducing device to select a program for recording.

4. (original): The multi-media system of claim 3, wherein the input device is a remote controller.

5. (original): The multi-media system of claim 4, further comprising at least one additional recording/reproducing device connected to the receiver, wherein all of the recording/reproducing devices are controlled by the remote controller.

6. (original): The multi-media system of claim 3, wherein the first and second digital interfaces are an IEEE 1394 interface, respectively.

7. (original): The multi-media system of claim 6, wherein the receiver further comprises a first extra header inserter/remover for inserting an extra header into the selected single transport stream output from the single transport stream extractor, to form a data block packet for the IEEE 1394 transfer, and for removing the extra header inserted into the reproduced data block packet provided by the first digital interface for the IEEE 1394 transfer.

8. (original): The multi-media system of claim 6, wherein the recording/reproducing device further comprises a second extra header inserter/remover for removing an extra header

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

inserted into a data block packet provided by the second digital interface for the IEEE 1394 transfer, and for inserting the extra header into the reproduced single program transport stream output by the second signal processor, to form a data block packet for the IEEE 1394 transfer.

9. (original): The multi-media system of claim 3, wherein the receiver further comprises a switching controller for selectively outputting the received multi-program transport stream to the first signal processor in a display mode, the selected single program transport stream output from the single transport stream extractor to the first digital interface in a recording mode, and the reproduced single program transport stream reproduced by the recording/reproducing device and received via the first digital interface to the first signal processor in a playback mode, according to a mode switching control signal.

10. (original): The multi-media system of claim 3, wherein the first signal processor further comprises:

a program guide parser for parsing program guide information from the received multi-program transport stream; and

an on-screen graphic (OSG) generator for displaying the parsed program guide information on an OSG display.

11. (original): The multi-media system of claim 10, wherein the OSG generator generates an OSG by mixing the program guide information with a graphic signal of a background screen.

12. (original): The multi-media system of claim 10, wherein the OSG generator generates an OSG by mixing the program guide information with the decoded video signal.

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

13. (original): The multi-media system of claim 10, wherein the second signal processor does not, in itself, parse program guide information from the selected single program transport stream transferred via the second digital interface.

14. (original): The multi-media system of claim 3, wherein the first signal processor further comprises:

a program guide parser for parsing program guide information from the received multi-program transport stream; and

an on-screen display (OSD) generator for displaying the parsed program guide information on an OSD.

15. (original): A method of transferring a single program transport stream from a receiver with a digital interface for receiving a multi-program transport stream to a recording/reproducing device with a digital interface for recording/reproducing a single program transport stream, the method comprising the steps of:

(a) providing a program number of an intended program to be recorded;

(b) correcting a program association table (PAT) from a received multi-program transport stream to output a corrected PAT including a program number corresponding to the program number provided in the step (a) and program information corresponding to the program number; and

(c) extracting a single program transport stream corresponding to the program number provided in the step (a) from the received multi-program transport stream, and transferring the extracted single program transport stream together with the corrected PAT, to the recording/reproducing device,

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

wherein receiving the single program transport stream together with the corrected program association table by the recording/reproducing device obviates need for a selection device associated with the recording/reproducing device to select a program for recording.

16. (original): The method of claim 15, wherein the step (a) comprises the steps of:

(a1) parsing program guide information within the transport stream;

(a2) displaying the parsed program guide information; and

(a3) providing the program number of an intended program according to the displayed program guide information.

17. (original): The method of claim 16, wherein the step (a2) comprises displaying the parsed program guide information on an OSG display.

18. (original): The method of claim 16, wherein the step (a2) comprises displaying the parsed program guide information on an OSD display.

19. (original): The method of claim 15, further comprising the steps of:

(d) providing a program number of an intended program to be reproduced; and

(e) transferring to the receiver a single program transport stream reproduced by the recording/reproducing device, corresponding to the program number provided in the step (d).

20. (original): A multi-media system for transferring a single program transport stream comprising:

an input device for entering a program number of an intended program; and

a receiver including a digital interface, for receiving a multi-program transport stream and extracting a single program transport stream of a program corresponding to the program number from the received multi-program transport stream, and for transferring the extracted

single program transport stream together with a corrected program association table (PAT) including the program number and program information corresponding to the program number, wherein transferring the extracted single program transport stream together with the corrected program association table to a recording/reproducing device obviates need for a selection device associated with the recording/reproducing device to select a program for recording.

21. (original): A multi-media system for transferring a single program transport stream, including a receiver for receiving a multi-program transport stream, the receiver comprising:

an input device for entering a program number of an intended program;

a first signal processor for parsing a program association table (PAT) from the received multi-program transport stream, and for separating a video stream and an audio stream of an intended program, based on the parsed PAT, to decode a video signal and an audio signal, respectively;

a PAT corrector for correcting the parsed PAT to output a corrected PAT including the program number and program information corresponding to the program number;

a single transport stream extractor for extracting the selected single transport stream corresponding to the program number from the received multi-program transport stream, to output the selected single program transport stream, together with the corrected PAT; and

a digital interface for transferring the selected single program transport stream,

wherein transferring the selected single program transport stream together with the corrected program association table to a recording/reproducing device obviates need for a

PRELIMINARY AMENDMENT

selection device associated with the recording/reproducing device to select a program for recording.

22. (new) A method for transferring a single program transport stream from a receiver with a digital interface for receiving a multi-program transport stream to a recording/reproducing device with a digital interface for recording/reproducing a single program transport stream, the method comprising the steps of:

(a) providing a program selection information of an intended program to be recorded;
(b) correcting an association table from a received multi-program transport stream to output a corrected association table including a program number corresponding to the program selection information provided in the step (a) and program information corresponding to the program number; and

(c) extracting a single program transport stream corresponding to the program number provided in the step (a) from the received multi-program transport stream and transferring the extracted single program transport stream together with the corrected association table, to the recording/reproducing device;

wherein receiving the single program transport stream together with the corrected association table by the recording/reproducing device obviates need for a selection device associated with the recording/reproducing device to select a program for recording.

23. (new): The method of claim 22, wherein the step (a) comprises the steps of:

(a1) parsing program guide information within the transport stream;
(a2) displaying the parsed program guide information; and

PRELIMINARY AMENDMENT

Reissue Application of U. S. Patent No. 6,366,731

(a3) providing the program selection information of an intended program according to the displayed program guide information.

24. (new): The method of claim 23, wherein the step (a2) comprises displaying the parsed program guide information on an OSG display.

25. (new): The method of claim 23, wherein the step (a2) comprises displaying the parsed program guide information on an OSD display.

26. (new): The method of claim 22, further comprising the steps of:

(d) providing a program selection information of an intended program to be reproduced;
and

(e) transferring to the receiver a single program transport stream reproduced by the recording/reproducing device, corresponding to the program selection information provided in the step (d).
